A claimed method of Corn, sorghum, sunflower, safflower, wheat, rice, alfalfa or collseed Brassica) and antibody compositions. A claimed method of CC modulating the level of CycD protein in a cell comprises cransforming the cell with a recombinant expression cassette comprising a CycD polynucleotide linked to a promoter, and cycD polynucleotide sufficient to induce expression of the CC CycD protein in the cell. The CycD protein is present in an amount considered to alter cell division, increase or decrease) the CC CycD protein in the cell. The CycD protein is present in an amount conficient to alter cell division, increase the number of cells confidered to a size, enhance or inhibit organ (seed, root, shoot, ear, tassel, stalk, pollen, stamen) growth, produce organ ablation, confidered, stalk, pollen, stamen) growth, produce organ ablation, confidered, stalk, pollen, stamen) growth, produce organ ablation, increase plant regeneration, alter the time cycle, improve response, increase callus induction, provide that cells are arrested in G1 or G0 phase or in a particular cell cycle, improve response to environmental stress including dehydration, heat or cold, increase the number of seeds per pod or ear, alter the lag time in cycle, increase the number of seeds per pod or ear, alter the lag time in confidered to the growth rate of cells in bioreactors. The level of cold increase the growth rate of cells in bioreactors. The level of the cold in the cold 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches 131;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

corrections in and texpression cassettes (including Zmcycli in sense or castettes), host cells, transgenic plants (especially corn, sorghum, sunflower, safflower, wheat, rice, alfalfa or collseed Brassica) and antibody compositions. A claimed method of modulating the level of CycD protein in a cell comprises comprising a CycD polynucleotide linked to a promoter, and growing the cell with a recombinant expression cassette comprising a CycD polynucleotide linked to a promoter, and cycD polynucleotide linked to a promoter, and cycD polynucleotide inked to a promoter, and cycD polynucleotide inked to a promoter, and cycD polynucleotide sufficient to induce expression of the polynucleotide sufficient to modulate (increase or decrease) the cycD protein in the cell. The CycD protein is present in an amount sufficient to alter cell division, increase the number of cells dividing, improve transformation frequencies, alter cell growth, cincrease the growth rate, increase crop yield, alter plant height or size, enhance or inhibit organ (seed, root, shoot, ear, cassel, stalk, pollen, stamen) growth, produce organ ablation, creasel, stalk, pollen, stamen) growth, produce organ ablation, provide positive selection, increase plant regeneration, alter the time constitute selection, increase plant regeneration, alter the time that cells are arrested in G1 or G1 organ ablation and cell cycle, improve response to environmental stress including character or cold, increase the number of pods per plant, increase the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in crease the number of seeds per pod or ear, alter the lag time in the cell creates 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   retinoblastoma associated protein, releasing the E2F transcription factor which activates DNA synthesis. The invention provides maize CycD polynucleotides (see AA294581-84) and propertides (see AA279321-24) that are involved in cell cycle regulation. Also provides the contraction of the contraction of the cycle of t
                                                                  seed development, provide hormone independent cell growth, or increase the growth rate of cells in bioreactors. The level of CycD protein in the cells is transiently modulated by introducing CycD kNA or CycD polypeptides. All claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of an isoform of maize cyclin D (CycD), a protein necessary for progression from G1 into S phase. CycD binds to CDK4, and the active CycD-CDK4 hyperphosphorylates retinoblastoma associated protein, releasing the E2F transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotides encoding maize cyclin D isoforms 1, 2 and 3, related proteins and antisense RNA useful for control of cell cycle regulation -

The present sequence is that of an isoform of malze cyclin D (CycD), a protein necessary for progression from G1 into S phase. CycD binds to CDK4, and the active CycD-CDK4 hyperphosphorylates retinoblastoma associated protein, releasing the E2F transcription factor which activates DNA synthesis. The invention provides maize CycD polynucleotides (see AAX94581-84) and polypeptides (see AAX9479321-24) that are involved in cell cycle regulation. Also provider recombinant expression cassettes (including ZmcycD in sense or antisense orientation), host cells, transgenic plants (especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY79323;

A claimed method of CC modulating the level of CycD protein in a cell comprises.

CC transforming the cell with a recombinant expression cassette comprising a CycD polynucleotide linked to a promoter, and cycD protein in the cell for a time sufficient to induct on the comprises.

CC cycD protein in the cell. The CycD protein is present in an amount contract of cells are real division, increase or decrease) the cclividing, improve transformation frequencies, alter cell growth, cc increase the growth rate, increase crop yield, alter plant chaight or size, enhance or inhibit organ (seed, root, shoot, ear, cc tassel, stalk, pollen, stamen) growth, produce organ ablation, compositive selection, increase callus induction, provide constitive selection, increase plant regeneration, alter the time cc that cells are arrested in Gl or GO phase or in a particular cell cycle, improve response to environmental stress including cells increase the number of pods per plant, concease the number of pods per plant, concease the number of cells time in cc seed development, provide hormone-independent cell growth, or cc concease the number of cells in bioreactors. The level of cycD protein in the cells is transiently modulated by introducing cyclp RNA or CycD polypeptides. All claimed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein derived from the nucleotide sequence (see AAZ19961) of a clone from an embryo leaf cDNA library. It represents 94% of the full-length protein. The invention relates to isolated nucleic full-length protein. The invention relates to isolated nucleic acid fragments (see AAZ19953-66) encoding cyclin A, cyclin delta-1, cyclin delta-2 and cyclin delta-3 polypeptides (see AAX1889-902). It also relates to the construction of chimeric genes encoding all cor a portion of a cyclin, in sense or antisense orientation, where expression of the chimeric gene results in altered levels of the cyclin protein in a transformed host cell. This would have the cyclin protein in a transformed host cell. This would have the cells to enhance cell tissue culture growth. The availability of cells to enhance cell tissue culture growth. The availability of the onhance cell growth in tissue culture, increase the efficiency of gene transfer and help provide more stable transformations. The proteins can be used as targets to facilitate design and/or identification of the interference convenes that may be used for a protein constitution.

Submitted (JUL-1993) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: ESSENTIAL FOR THE CONTROL OF THE CELL CYCLE AT (MITOSIS) TRANSITION.

-I- SUBUNIT: INTERACTS WITH THE CDC2 PROTEIN KINASE TO FORM SERINE/THREONINE KINASE HOLOENZYME COMPLEX ALSO KNOWN AS MATURATION PROMOTING FACTOR (MPF). THE CYCLIN SUBUNIT IM SUBSTRATE SPECIFICITY TO THE COMPLEX.

-I- DEVELOPMENTAL STAGE: ACCUMULATES STEADILY DURING G2 AND ABRUPTLY DESTROYED AT MITOSIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-OCT-1994 (Rel. 30, Creat

-i- FUNCTION: ESSENTIAL FOR THE CONTROL OF THE CELL CYCLE AT THE C (MITOSIS) TRANSITION.

-i- SUBUNIT: INTERACTS WITH THE CDC2 PROTEIN KINASE TO FORM A SERINE/THREONINE KINASE HOLOEWZYME COMPLEX ALSO KNOWN AS MATURATION PROMOTING FACTOR (MPF). THE CYCLIN SUBUNIT IMPARTS SUBSTRATE SPECIFICITY TO THE COMPLEX.

-i- DEVELOPMENTAL STAGE: ACCUMULATES STEADILY DURING G2 AND IS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EMBL; x82040; CAA57560.1; -. "ISOlation and characterization of cDNA clones for plant cyclins.";

"ISOlation and characterization of cDNA clones for plant cyclins.";

EMBO J. 10:2681-2688 (1991).

-i- FUNCTION: ESSENTIAL FOR THE CONTROL OF THE CELL CYCLE AT THE G2/

(MITOSIS) TRANSITION.

-i- SUBUNIT: INTERACTS WITH THE CDC2 PROTEIN KINASE TO FORM A SERINE/THREONINE KINASE HOLDENZYME COMPLEX ALSO KNOWN AS MATURATION PROMOTING FACTOR (MPF). THE CYCLIN SUBUNIT IMPARTS SUBSTRATE SPECIFICITY TO THE COMPLEX.

-i- DEVELOPMENTAL STAGE: ACCUMULATES STEADILY DURING G2 AND IS ABROPTLY DESTROYED AT MITOSIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PFAM; PF00134; cyclin; 1.

(In) Plant Gene Register PGR97-001.
-1- FUNCTION: ESSENTIAL FOR THE CONTROL OF THE CELL CYCLE AT THE (MITOSIS) TRANSITION.
-1- SUBUNIT: INTERACTS WITH THE CDC2 PROTEIN KINASE TO FORM A SERINE/THREONINE KINASE HOLDENZYME COMPLEX ALSO KNOWN AS MATURATION PROMOTING FACTOR (MPF). THE CYCLIN SUBUNIT IMPARTS SUBSTRATE SPECIFICITY TO THE COMPLEX.
-1- DEVELOPMENTAL STAGE: ACCUMULATES STEADILY DURING G2 AND IS ABRUPTLY DESTROYED AT MITOSIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE-95261415; PubMed=7742859; Sauter M., Mekhedov S.L., Kende H.; Sauter M., Mekhedov S.L., Kende H.; "Gibberellin promotes histone HI kinase activity and the expression of cdc2 and cyclin genes during the induction of rapid growth in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Spermatophyta; Magnoliophyta; Ehrhartoideae; Oryzae; Oryza.

Patterns of cell division revealed by transcriptional regulation of genes during the cell cycle in plants.";

EMBO J. 13:616-624(1994).

1- FUNCTION: ESSENTIAL FOR THE CONTROL OF THE CELL CYCLE AT THE G2/M
(MITOSIS) TRANSITION. G2/M CYCLINS ACCUMULATE STEADILY DURING G2
AND ARE ABRUPTLY DESTROYED AT MITOSIS.

1- SUBBUNIT: INTERACTS WITH THE CDC2 AND CDK2 PROTEIN KINASES TO FORM A SERINE/THREONINE KINASE HOLOENZYME COMPLEX.

1- DEVELOPMENTAL STAGE: ACCUMULATES STEADILY DURING G2 AND IS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          P34800;
